The Benefits of Going Smarte™

Improve Test Design
Increase Test Coverage
Centralized Management
Track Changes
Manage Tasks

The SmarteSoft™ Product Suite

SmarteScript™

SmarteSoft's powerful and intuitive test automation application for functional and regression testing

SmarteX™

SmarteSoft's cost-effective solution for functional and regression test execution across multiple workstations

SmarteLoad™

SmarteSoft's fully-integrated load & performance tool that streamlines functional, performance, and load testing

SmarteTime™

SmarteSoft's Network & Storage aware Test Execution Scheduling Tool

SmarteSoft™ Professional Services

Assessment Services
Design Services
Implementation Services
Test Automation Services
Product Training

Smarte Quality Manager – The Complete QA Test Lifecycle Management System

Product Information Sheet

SmarteQM™ is an integrated QA Test Management System that manages your project's requirements, releases, test cases, issues and tasks in one unified environment.

The combination of a QA Management System, along with an agile-enabled Project Management solution, offers a truly unique and robust tool for managing development projects.

SmarteQM™ allows you to take control of your project lifecycle and synchronize the previously separate worlds of development and testing.

Requirements Management

SmarteQM™ provides the ability to create, edit and delete project requirements in a hierarchical organization that resembles a typical scope matrix. Each requirement is mapped to one or more test cases that can be used to validate that the functionality works as expected.

Release Management

SmarteQM™ provides the ability to manage the list of releases / versions of the software being tested. During the execution cycle, the Test Runs and Incidents are associated with a particular release. In addition, each release provides drill down capability to list the test runs performed with the associated issues.

Reporting & Analysis

SmarteQM™ includes an extensive library of printable reports and graphical charts for:

Requirements Reports & Graphs
Release Reports
Test Case & Graphs
Incident Reports & Graphs
Task Reports & Graphs

Test Case Management

SmarteQM™ provides the ability to create, edit and delete project test cases that are stored in a hierarchical folder structure. Each test case consists of a set of steps that represent the actions a user must take to complete the test.

Each test case is mapped to one or more requirements, thus providing test coverage for the requirement and providing complete traceability from a recorded incident to the underlying requirement.

Incident & Defect Tracking

SmarteQM™ provides the ability to create, edit, assign, track, manage and close incidents that are raised during the testing of the software system under development. Incidents can be categorized into bugs, issues, change requests, and risks. Each type has its own specific workflow and business rules.

Unlike a standalone issue tracking tool, you can trace the incidents back to the test case and the underlying requirement that generated them, giving the project owner unprecedented oversight of the "in-process" quality of a system during its lifecycle.
